Continuation of 11. does NOT place the application in condition for allowance because: Applicant's arguments have been considered in depth, however they are not persuasive. For instance, Applicant argues that the Millbocker device cannot function as the current invention in that the fluid in applicant's chamber array does not flow back down the cardiac wall but instead continues past the base to a reservoir. This argument is moot absent any structure to support this functionality. Further, since Millbocker teaches apex to base force application as mentioned in the previous office action, the resultant function is the same as that in applicants invention as currently claimed, namely intermittent inflation and deflation starting at the apex to the base in a rhythmic massage. Applicant next argues that that Millbocker causes back-flow into the ventricles. While this may be true, there is no structure set forth to inhibit this back-flow in the currently presented claims. Applicant goes on to argue the differences in functionality of Millbocker and how it differs from the disclosed invention, however in no instance notes a difference in the claims and the Millbocker structure. Also, the amedments to Claim 1 would add 35 USC 101 and 112, 2nd paragraph issues if entered.
